

AgriVision — Leaf Disease Scan Report

Report ID: AGV-20260803-01AC21 | Scanned: 2026-08-03 15:42 UTC

Reliability warning: Low prediction confidence (42%) — this may not be one of the 6 supported crops (Apple, Grape, Corn, Tomato, Strawberry, Peach), or the image quality/angle made it hard to classify. Treat this result with caution.

Original Image

Disease-Highlighted Image

Plant Species	Corn
Disease	Common Rust
Prediction Confidence	41.9%
Affected Leaf Area	35.4%
Severity	Severe

Urgent: Severity is Severe: isolate or remove severely affected plant material promptly and consider a follow-up scan after treatment to confirm improvement.

Treatment Recommendations

Apply a labeled fungicide if rust develops before tasseling on susceptible hybrids.

Prevention Recommendations

Plant rust-resistant hybrids; rust is usually not yield-limiting on resistant varieties.

Methodology note: disease classification model status is 'fine_tuned'. Infected-area segmentation used the 'classical_cv' backend, a classical color-based image analysis method (not a trained neural segmentation model) unless otherwise noted. Results are decision support, not a substitute for in-person diagnosis by a plant pathologist for high-value or ambiguous cases.
