

AgriVision — Leaf Disease Scan Report

Report ID: AGV-20260803-DFFCE1 | Scanned: 2026-08-03 09:24 UTC

Original Image

Disease-Highlighted Image

Plant Species	Apple
Disease	Apple Scab
Prediction Confidence	25.1%
Affected Leaf Area	27.5%
Severity	Severe

Urgent: Severity is Severe: isolate or remove severely affected plant material promptly and consider a follow-up scan after treatment to confirm improvement.

Treatment Recommendations

Apply a fungicide labeled for apple scab (e.g. captan or a triazole) starting at green-tip stage and repeat per label interval through wet spring weather. Remove and destroy fallen leaves in autumn to cut inoculum.

Prevention Recommendations

Plant scab-resistant cultivars where possible. Prune for good air circulation and avoid overhead irrigation that keeps foliage wet.

Methodology note: disease classification model status is 'fine_tuned'. Infected-area segmentation used the 'classical_cv' backend, a classical color-based image analysis method (not a trained neural segmentation model) unless otherwise noted. Results are decision support, not a substitute for in-person diagnosis by a plant pathologist for high-value or ambiguous cases.
