

AgriVision — Leaf Disease Scan Report

Report ID: AGV-20260803-F14E53 | Scanned: 2026-08-03 09:19 UTC

Original Image

Disease-Highlighted Image

Plant Species	Grape
Disease	Black Rot
Prediction Confidence	48.0%
Affected Leaf Area	41.5%
Severity	Severe

Urgent: Severity is Severe: isolate or remove severely affected plant material promptly and consider a follow-up scan after treatment to confirm improvement.

Treatment Recommendations

Apply fungicide starting at 2-3 inch shoot growth and continue through fruit set per label; remove mummified berries.

Prevention Recommendations

Prune for canopy airflow, remove infected plant debris, and avoid working in wet vineyards.

Methodology note: disease classification model status is 'fine_tuned'. Infected-area segmentation used the 'classical_cv' backend, a classical color-based image analysis method (not a trained neural segmentation model) unless otherwise noted. Results are decision support, not a substitute for in-person diagnosis by a plant pathologist for high-value or ambiguous cases.
